Phase 6: Project Testing

Purpose: Confirm that the implemented workflow behaves according to the project requirements.

Test scenario

Place a Standard Laptop order, complete the approval, then verify that the automation creates a Catalog Task with the expected values and Hardware assignment.

Test cases

TC	Test action	Expected result
TC-01	Open Service Catalog → Hardware → Standard Laptop.	Standard Laptop item is available.
TC-02	Click Order Now and place the request.	Order/request is created and an order status can be viewed.
TC-03	Open Request Number and Approvers section.	Approval record is available.
TC-04	Approve the request.	Requested Item reaches Approved state for the configured flow condition.
TC-05	Open the Requested Item and Catalog Tasks section.	A Catalog Task has been created by the flow.
TC-06	Open the Catalog Task record.	Short description is “Laptop need to Configured”.
TC-07	Inspect task description.	Description is “Laptop need to Configured”.
TC-08	Inspect Assignment group.	Assignment group is Hardware.
TC-09	Inspect task/status information.	Updated task status/details are visible for verification.

Testing checklist

- Flow is active.
- Standard Laptop catalog item uses the configured flow.
- Request can be submitted.
- Approval can be completed.
- Catalog Task is created after approval.
- Requested Item is correctly linked to the task.
- Short description and description are populated.
- Assignment group is Hardware.
- Final task record can be opened and inspected.

Defect handling

If a test fails, verify the flow trigger, Requested Item input, approval value, task field values, flow activation status, and the Process engine configuration of the Standard Laptop item before rerunning the test.
